

# Bunny Cart Performance Testing

## 1. Creating Test Plan For Bunny Cart

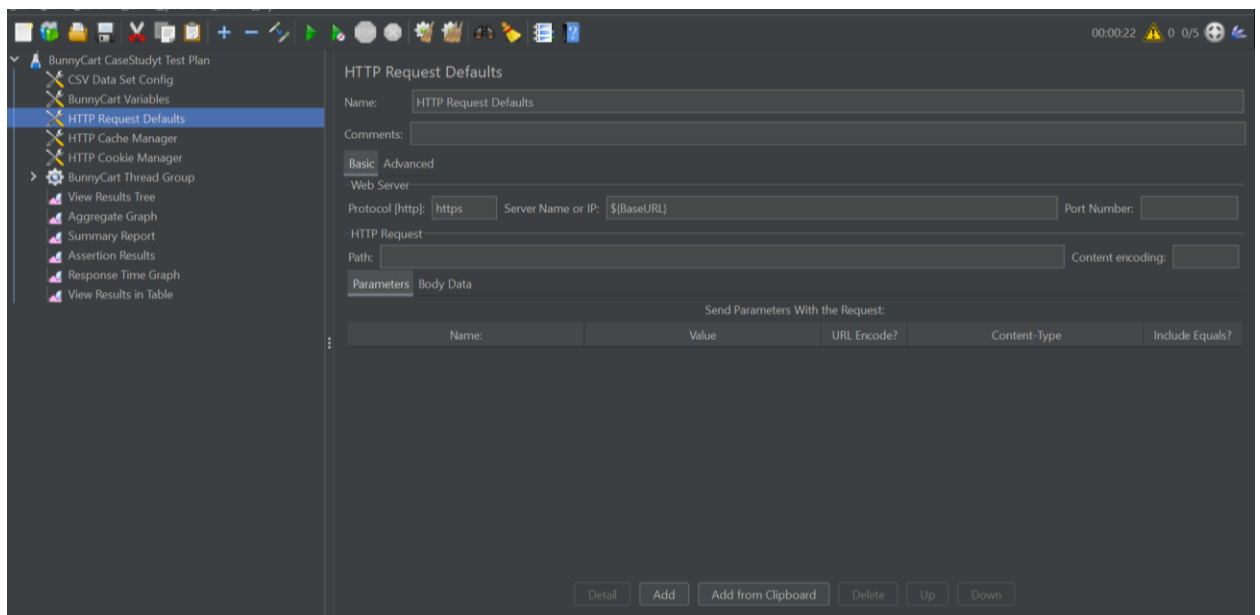

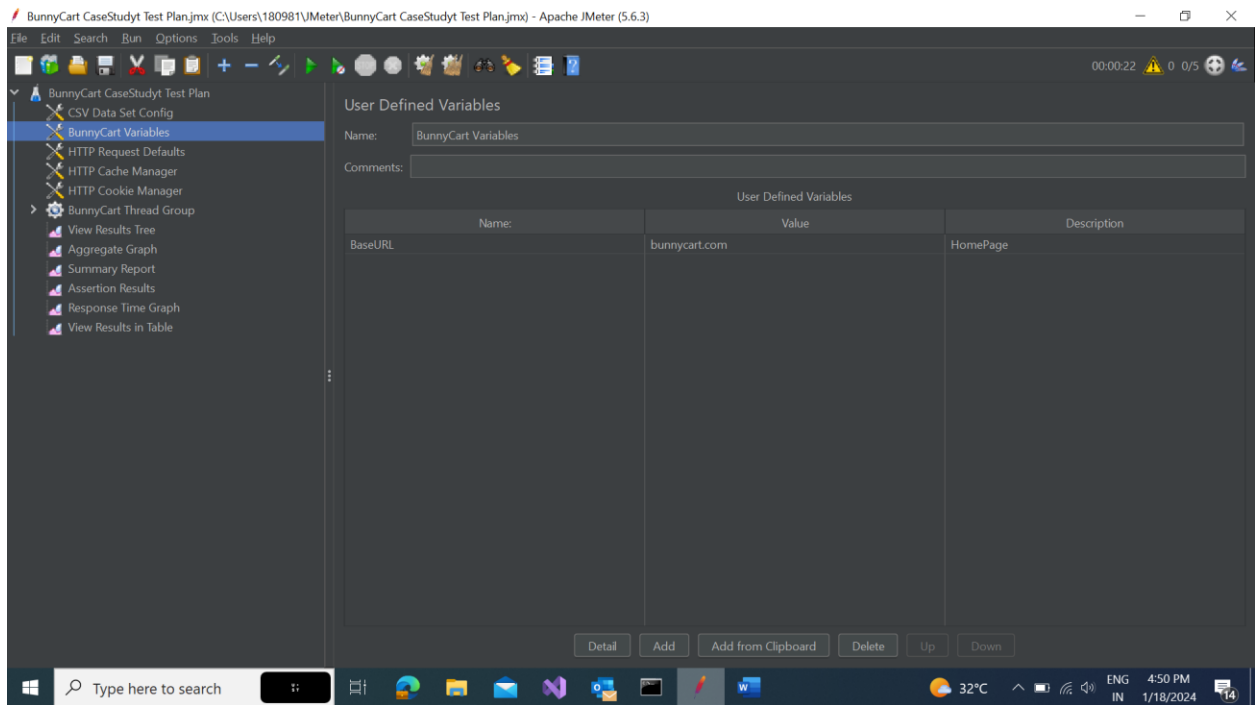

## 2. Creating User Defined Variable

This user defined variable means the base URL of bunny cart so this we can use any where in the test plan(One time setup).

## 3. Creating Http Request Default

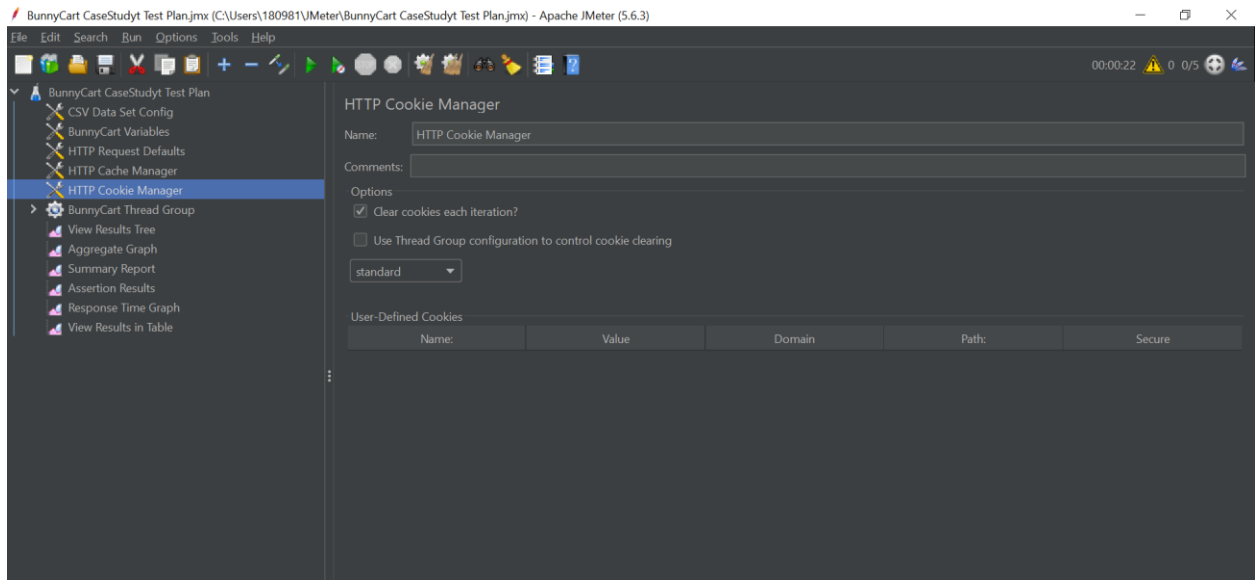

This means that in above step creating a user defined variable so we can use that variable as in Http request default. This Http default request take the entire sampler request automatically.

In the above image adding the `${BaseURL}` This way we can call user defined variable from my HTTP default request.

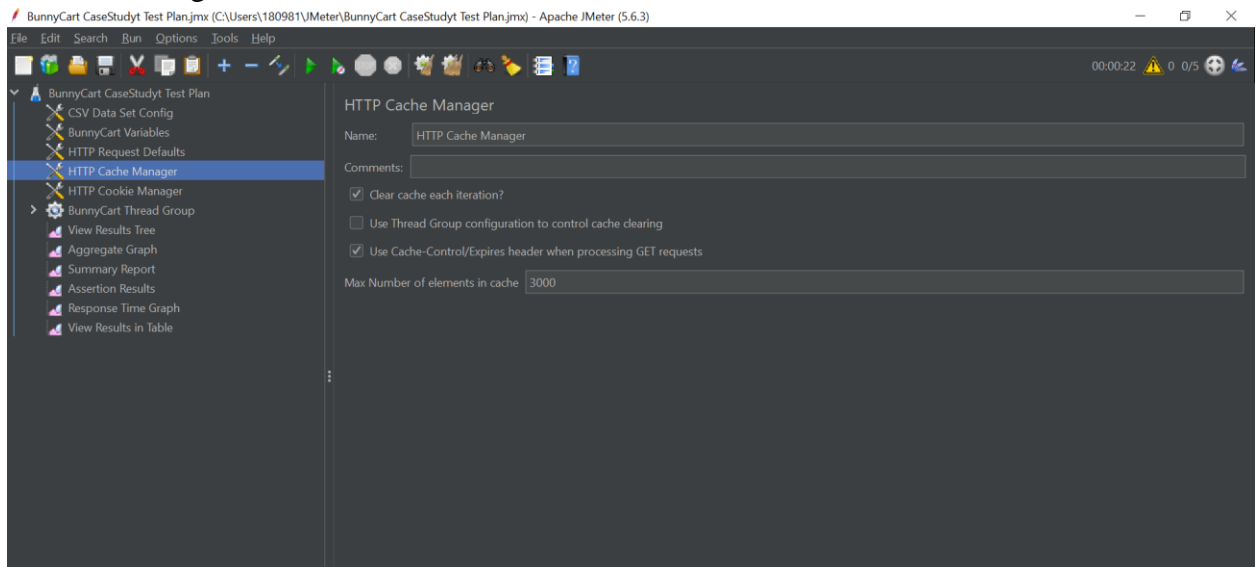

#### 4. Creating Http Cookie Manager

In this, clearing each cookie on each iteration.

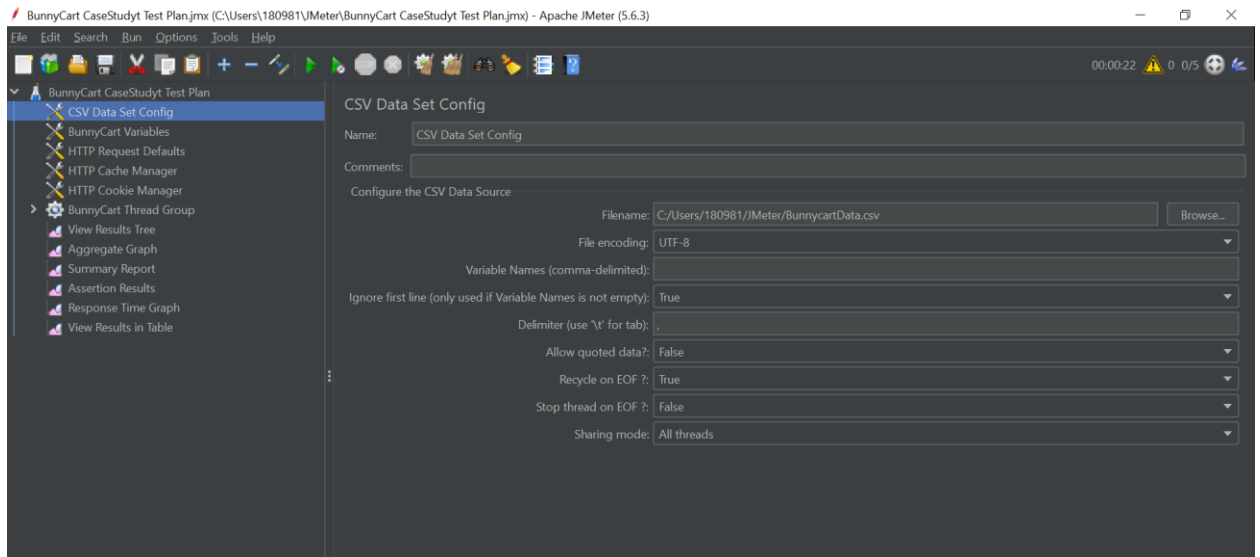

## 5. Creating Http Cache Manager

In this, clearing cache on each iteration use cache control.

## 6. Creating Csv Data Set Config

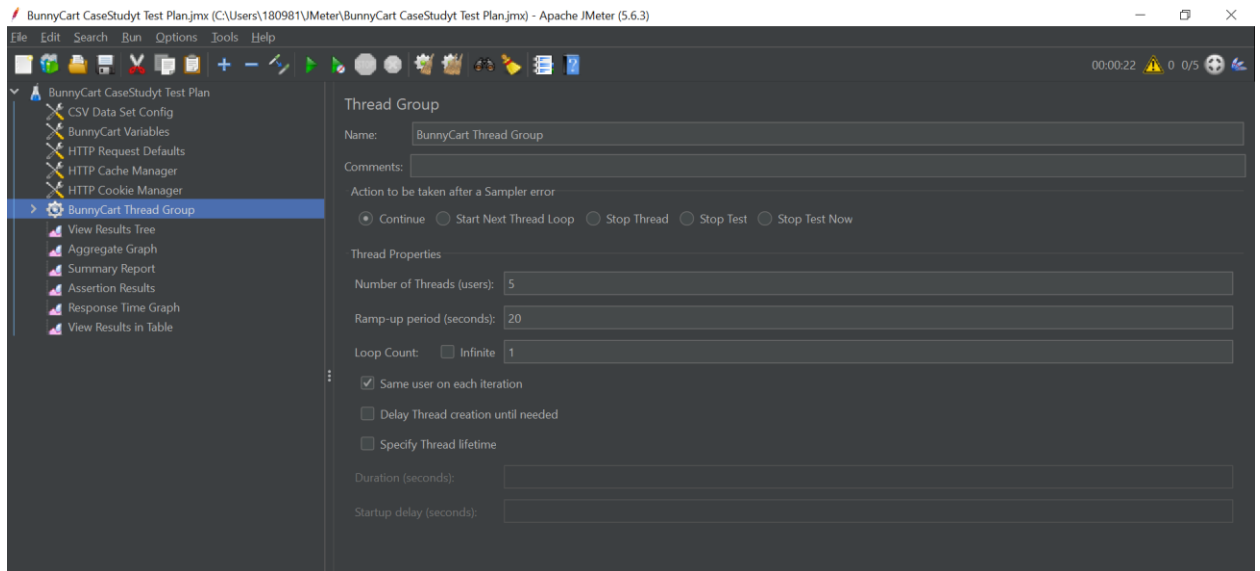

This is for Reading data from external csv file like data driven.

The above six steps are One time setup model.

## 7. Creating Thread Group

This Thread Group means we are setting the number of users and how much ramp period we want, and how much iteration required those things mention in Thread group.

## 8. Creating Different Http Request

In Http request I created three request one is for homepage, product page, Click products. Inside each request I also create assertions.

In that http requests I am using parameterization and csvdataconfig also.

## 9. Inside Thread Group creating Listener

Listener is for generating reports.

## 10.Finally Run JMeter without Gui Only Using Command Lines

In This Steps generating log result and reports folder.

In this, showcasing how reports edits in custom manner (By using JMeter->Bin->User reports edit)

```

```

Using the above command automatically create a log result and reports also. you can see in below images.

Fig for Log results.
